

Anti-tracking solution for Dutch communication power cabinets

AI Overview

To prevent tracking and electromagnetic interference in communication power cabinets, use a combination of Faraday shielding, EMI filters, and smart power distribution units with proper grounding.

Shielding and Enclosure Design

Faraday cages or shielded enclosures are highly effective for preventing external RF signals from entering or leaving a cabinet. Prefabricated modular Faraday cages made from galvanized Mu-Ferro steel panels with conductive gaskets provide superior protection against RF, LF, and HF signals, and can be customized to fit existing cabinet sizes (). For cabinets with windows, shielded laminated glass with a conductive mesh can maintain visibility while preserving electromagnetic shielding (). Honeycomb ventilation panels and screened windows ensure airflow without compromising shielding ().

Electromagnetic Interference (EMI) Protection

Smart Power Distribution Units (PDUs) with advanced filtering and surge protection help prevent EMI from affecting sensitive telecom equipment. Passive EMI filters (capacitors, inductors, ferrite chokes) and active filters reduce high-frequency noise, while multi-stage surge protection safeguards against voltage spikes (). Proper grounding strategies, such as bonding all subsystems to a low-impedance ground plane and separating grounds for structure, signal, and power systems, further minimize interference ().
