

Charging Pile Cable Tray Mounting Bracket

AI Overview

Proper installation of cable tray brackets for charging piles ensures safe, stable, and code-compliant routing of EV charging cables.

Material Inspection and Preparation

Before installation, all cable trays, brackets, and accessories must be inspected for damage and verified against approved material submittals. Any defective or non-compliant materials should be removed from the site immediately. Materials should be stored horizontally on a flat surface with timber supports at intervals of about one meter and protected from moisture and direct sunlight .

Bracket and Support Installation

- **Support Spacing:** Ladder-type trays should have a maximum support spacing of 3 meters, while perforated trays should not exceed 2 meters to prevent sagging or strain on cables .
- **Mounting Methods:** Brackets can be fixed to steel structures, standard steel shapes, or concrete surfaces using self-drilling dowels or welding, depending on the project requirements .
- **Load Capacity:** Brackets and trays should be designed to carry a load of 100 kg/m, ensuring they can support the weight of multiple charging cables .
- **Alignment:** Trays should be installed flat and level wherever possible. Vertical or edgewise installations are only used in special cases, with cables secured using stainless steel strips (two per meter for vertical trays), .
