

# Ddr4 optical module

## Overview

A 400G DR4 Optical Transceivers module aggregates four independent 100 Gbps lanes—each modulated with PAM4 (4-level Pulse Amplitude Modulation) on a 1310 nm wavelength—and transmits them in parallel over standard single-mode fiber (SMF) up to 500 m. These standards guide users in selecting the right optical module for their network's specific distance and performance needs. PAM4 allows each symbol to represent two bits of information. In this field, the 400G DR4/DR4+ and FR4 optical transceivers have attracted widespread attention. This blog will delve into the. Defined by the QSFP-DD MSA group, it is a high-speed, hot-pluggable form factor crucial for high-density networking in the optical communication industry. As the number and density of ports go on, data centers have to take the cost of optical modules into consideration since it is expected to account for nearly half of the cost of optical networks in.
