

Galvanized cable trays with shielding layer

Overview

The full-shaped HDG trays are dipped into a large bath of hot, liquid zinc. This encompasses every corner, hole, and edge. It is this heavy shield that makes the metal resistant to rain and salt air for over 20 years or more. ABB offers steel cable tray with pre-galvanized and hot-dip galvanized. Galvanization is an economical and effective way to protect steel against corrosion. Steel naturally oxidizes when exposed to air, but at a much slower rate than steel. Zinc provides sacrificial protection, which means that it corrodes while protecting the steel without notice. All illustrations, descriptions and technical information included in this document are provided as indications and can vary. Cable trays are equivalent. Our cable trays are produced in fit for purpose materials like stainless steel, galvanized, aluminium and fibreglass (FRP/GRP) composites to suit any project type both offshore and onshore. It is ideal for installations where it is essential to mitigate the effects of magnetic fields. Clear cable routing – Organized and safe cable management, easy maintenance, helps prevent failures.
