

How to connect bare wires to a distribution box

AI Overview

To connect bare wires in a distribution box, always ensure the main power is off, strip the insulation properly, and securely attach each wire to its designated terminal using the correct torque and safety practices.

Safety First

Before starting, turn off the main power supply to prevent electric shock or arc faults. Use insulated tools and wear protective gloves and eyewear. Verify the power is off with a multimeter before touching any wires .

Preparing the Wires

- Strip the insulation from the ends of the wires to expose the bare conductor, typically about 1/2 inch (12–15 mm).
- Ensure the exposed wire is clean and free of corrosion. For aluminum conductors, apply an anti-oxidant compound to prevent corrosion at the terminal points .
- Twist stranded wires neatly to prevent fraying and ensure a solid connection.

Connecting Wires to Terminals

- Live (Phase) Wires: Usually brown, red, or black. Connect to the main terminal or circuit breaker input. Tighten the terminal screws to the manufacturer-specified torque .
- Neutral Wires: Typically white or gray. Connect to the neutral bus bar. In main panels, the neutral and ground may be bonded; in subpanels, keep them isolated .
