

How to set the mode of a fiber optic sensor

AI Overview

To set the mode of a fiber optic sensor, press and hold the MODE button to enter configuration, then use the manual or adjustment buttons to select the desired detection mode, response speed, or threshold settings.

Step-by-Step Guide for Keyence FS-N Series Sensors

- Enter Mode Setting: Press and hold the MODE button for approximately 3 seconds to access advanced settings .
- Select Response Speed: When “Fine” flashes on the display, press the manual button to choose the response speed. For example, selecting “hSp” sets high-speed mode with a 50 μ s response time .
- Set Detection Threshold: Press the MODE button to move to threshold settings. The display will flash “set” or “setP” for percentage calibration. Use the manual button to adjust the threshold (e.g., 10%–15% of light intensity), .
- Confirm Settings: Press the MODE button once more to confirm. The current display will show the received light intensity, indicating the sensor is ready for operation .
- Optional Preset: Use the PRESET button to save commonly used settings for quick recall .

Additional Tips

- Power Mode Selection: Some sensors allow fixing the power mode to “MEGA mode” using a power select switch to ensure consistent light emission
