

How to wire a three-level distribution box

AI Overview

Wiring a three-level (three-phase) distribution box involves connecting the main supply to an MCCB, distributing each phase to MCBs, and properly linking neutral and earth for safe and balanced power distribution.

Overview

A three-phase distribution box (DB) is used to distribute electrical power efficiently across multiple circuits or floors in commercial, industrial, or multi-story buildings. It typically includes a main MCCB (Molded Case Circuit Breaker), three-pole MCBs for individual loads, neutral and earth busbars, and sometimes RCCBs for additional protection. Each phase carries AC current with a 120° phase shift, allowing balanced load distribution and reduced energy losses.

Step-by-Step Wiring Process

- Main Supply Connection
- Bring the three-phase supply (L1, L2, L3) and neutral from the utility or main energy meter into the DB.
- Connect the incoming lines to the main MCCB, which acts as the primary switch for the entire system.
- Phase Distribution
- From the MCCB, connect each phase to the input terminals of the three-pole MCBs.
- Use busbars to distribute power efficiently to multiple MCBs, especially in high-current or multi-story installations.
