

How to wire the distribution box and conduit

AI Overview

To connect wiring to a distribution box via conduit, select the appropriate conduit type, cut and prepare it, attach it securely to the box using the correct fittings, and pull the wires through safely.

Step 1: Select Conduit and Materials

Choose the conduit type based on your installation needs: PVC, EMT (Electrical Metallic Tubing), or rigid metal conduit. Ensure the conduit diameter matches the knockout or hub size on the distribution box. You will also need connectors, locknuts, PVC cement (for PVC), and basic tools such as a hacksaw, deburring tool, screwdriver, and measuring tape .

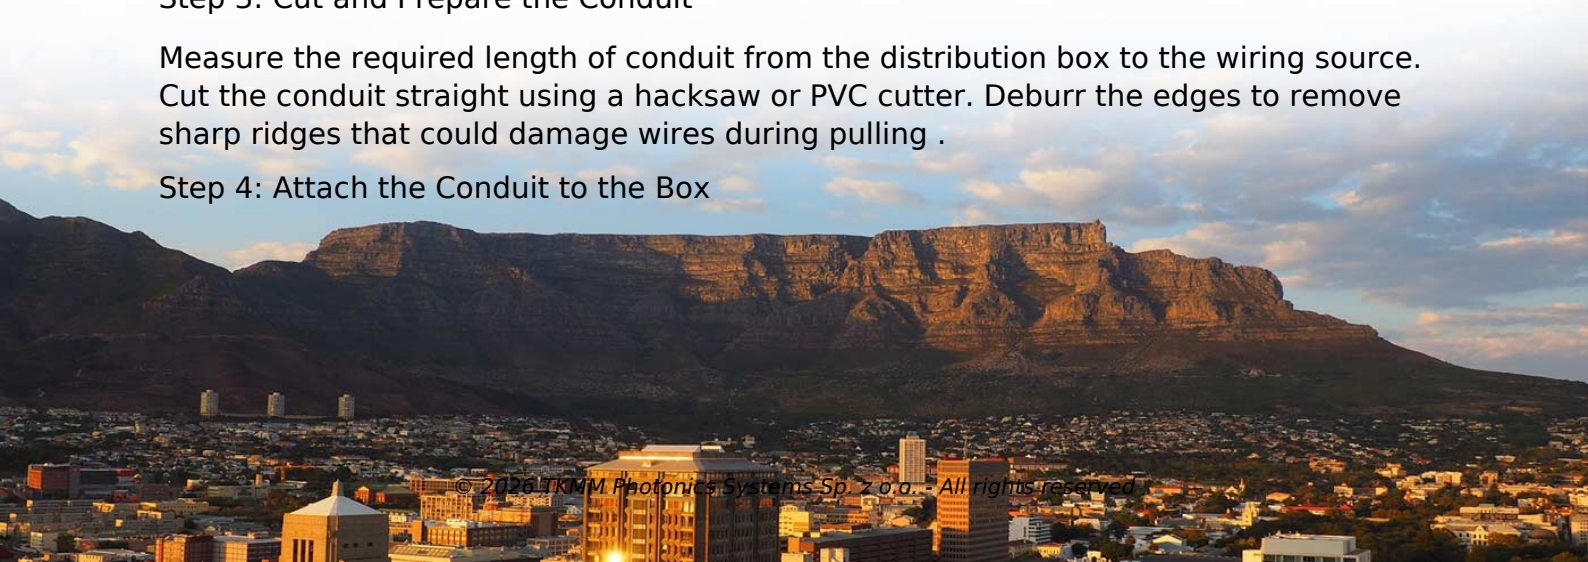

Step 2: Prepare the Distribution Box

Identify the knockout or hub where the conduit will enter. Remove the knockout carefully using a screwdriver, hammer, or knockout tool to create a clean opening. Ensure the box is properly mounted and grounded according to electrical codes .

Step 3: Cut and Prepare the Conduit

Measure the required length of conduit from the distribution box to the wiring source. Cut the conduit straight using a hacksaw or PVC cutter. Deburr the edges to remove sharp ridges that could damage wires during pulling .

Step 4: Attach the Conduit to the Box
