

Method of wiring out of the distribution box

AI Overview

To output wiring from a distribution box, connect the load circuits to the output terminals of the MCBs or RCCBs, ensuring proper phase, neutral, and earth connections.

Step-by-Step Guide

1. Identify Input and Output Sides

- The input supply (phase and neutral) is connected to the Main MCB.
- The output of the Main MCB goes to the RCCB (if installed) for protection.
- The output of the RCCB is then distributed to the branch MCBs for individual loads .

2. Connect Output Loads

- For single-pole MCBs, connect only the phase wire from the RCCB output to the MCB input. The neutral wire of the load connects to the neutral link, and the earth wire connects to the earth link .
- For double-pole MCBs, connect both phase and neutral wires from the RCCB output to the MCB input. The load's phase and neutral wires are connected to the MCB output, and the earth wire goes to the earth link .

3. Wiring Direction and Organization

- Wiring from the main circuit breaker to branch breakers is typically routed on the left side of the box, while wiring out to loads is routed on the right side .
