

Sequence of Bundled Pigtail Reels

AI Overview

Bundled pigtail reels consist of multiple color-coded optical fibers, typically 12 per bundle, pre-terminated with connectors for efficient splicing and network deployment.

Overview

A fiber optic bundle pigtail is a set of optical fibers grouped together, usually in a reel, with one end terminated with a connector (such as SC, LC, or ST) and the other end left bare for fusion splicing to the main fiber cable . Each bundle typically contains 12 fibers, each color-coded for easy identification during installation . These bundles are available in singlemode (OS2) or multimode (OM1, OM2, OM3) types depending on network requirements .

Structure and Materials

The fibers in a bundle are surrounded by aramid fiber reinforcement for strength and wrapped in a PVC outer sheath with flame-retardant properties . The connectors use A-class ceramic ferrules to ensure low insertion loss, high return loss, and precise alignment . This design provides high repeatability, stability, and durability, suitable for dense network environments like data centers and LANs .

Installation Sequence

- Unroll the pigtail reel and identify each fiber by its color code.
- Prepare the main fiber cable by stripping and cleaning the core fibers.
- Fusion splice each pigtail fiber to the corresponding fiber in the main cable.
