

Should large cables be routed through cable trenches or cable trays

Overview

Cable tray is the preferred wiring method for industrial facilities, data centers, and large commercial buildings where routing dozens or hundreds of cables through individual conduits would be impractical and expensive. When cables aren't routed properly, they can get damaged or cause serious problems. Choosing between a cable tray and a cable trench helps keep cables safe, neat, and easy to manage. According to the Uptime Institute's 2023 Outage Analysis, human error contributes to nearly 80% of data center failures. While they serve the common purpose of routing and securing cables, these systems differ in design, application, installation, and. Among the most widely used solutions are cable trench and cable tray systems, each designed to meet different needs based on the installation environment and specific requirements. Cable trenches, typically used for underground cable installations, provide robust protection from environmental. Overhead cable management systems are found anywhere with large-scale cable runs. That includes data centers of all types (hyperscale, enterprise, colocation), manufacturing facilities, warehouses, and much more.
